

I have read about this issue in QST magazine, published by the American Radio Relay League (I am a ham and a member), and while much has been said about interference, I have not seen anything said about security. Piracy of Internet access through intercepting wireless data links has become a problem. It seems to me that data communications over power lines could add to the problem, and if it does, it may get out of control very quickly. This just might be a hacker's dream come true.
